Instruction Book

Lacunza congratulates you on your choice.
Certified under ISO 9001, Lacunza guarantees the quality of its appliances and undertakes to meet the needs of its customers.

Confident of the know-how afforded by more than 50 years' experience, Lacunza uses advanced technologies in the design and manufacture of its entire range of appliances. This document will help you install and use your appliance in optimum conditions for your comfort and safety.

1. PRESENTATION OF THE APPLIANCE

For optimum operation of the appliance, we advise you to read this manual carefully before switching on the appliance for the first time. In case of problems or concerns, we urge you to contact your dealer, who will cooperate with you.

In order to improve the product, the manufacturer reserves the right to make changes without notice by updating this document.

This appliance is designed to burn wood in absolutely safe conditions.

WARNING: Faulty installation may have serious consequences.

Installation and all necessary regular maintenance operations must be performed by an authorized installer in full accordance with the specifications set out in the legislation applicable in each country and this instruction book.

1.1. General characteristics

| | Unit | LOIRE 700 | LOIRE 800 |
|---|--------------------|--------------|--------------|
| Equipment classification | - | Type BE | Type BE |
| Operating device | - | Intermittent | Intermittent |
| Nominal Heat Output (N.H.O.) to atmosphere | kW | 10 | 11 |
| Efficiency at N.H.O. | % | 80 | 80 |
| CO emission at 13% O ₂ at N.H.O. | % | 0.04 | 0.06 |
| CO emission at 13% O ₂ at N.H.O. | mg/Nm ³ | 561 | 829 |
| NOx emission at 13% O ₂ at N.H.O. | mg/Nm ³ | 150 | 141 |
| OGC emission at 13% O ₂ at N.H.O. | mg/Nm ³ | 37 | 35 |
| PM emission at 13% O ₂ at N.H.O. | mg/Nm ³ | 25 | 25 |
| Gas mass flow at N.H.O. | g/s | 8.4 | 10.3 |
| Gas temperature at N.H.O. | °C | 287 | 252 |
| Gas temperature downstream of flue socket at N.H.O. | °C | 297 | 273 |
| Chimney temperature level | °C | T400 | T400 |
| Optimum flue draught | Pa | 12 | 12 |
| Wood consumption (beech) at N.H.O. | Kg/h | 3.07 | 3.29 |
| Dimensions of the firebox | | | |
| Width | mm | 604 | 704 |
| Depth | mm | 290 | 290 |
| Useful height | mm | 235 | 235 |
| Dimensions of the logs | cm | 60 | 70 |
| Volume heated (45w/m ³) at N.H.O. | m ³ | 178 | 222 |
| Log load frequency | h | 1 | 1 |
| Capacity of the ashpit | L | 0.9 | 0.9 |
| Weight | kg | 87 | 97 |
| Flue socket diameter | mm | 150 | 150 |
| Voltage (AC) | V | 230 | 230 |
| Frequency | Hz | 50 | 50 |
| Energy efficiency class | - | A | A |
| Energy efficiency index (EEI) | - | 106 | 106 |

Note: The values indicated in the above table are based on tests performed in accordance with UNE-EN 13229, with logs with no more than 18% humidity and pressure conditions as indicated in each case.

Warning: this appliance is designed and prepared to work with the types of fuel, degree of humidity of the fuel, fuel loads, fuel load frequencies, flue draught and system of installation indicated in this Instruction Book. Failure to respect these conditions may lead to problems with the appliance (deterioration, shorter useful life, etc.) which are not covered by the Lacunza warranty.

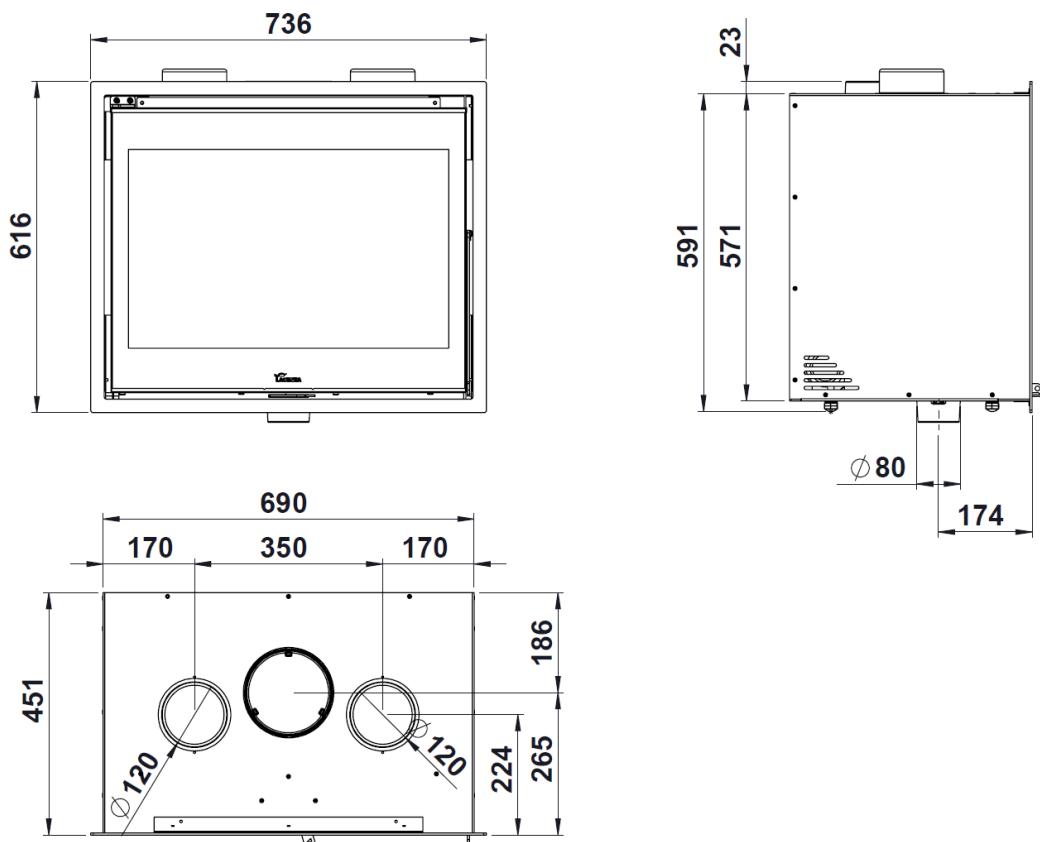

Figure No.1 - Dimensions of the LOIRE 700 appliance in mm

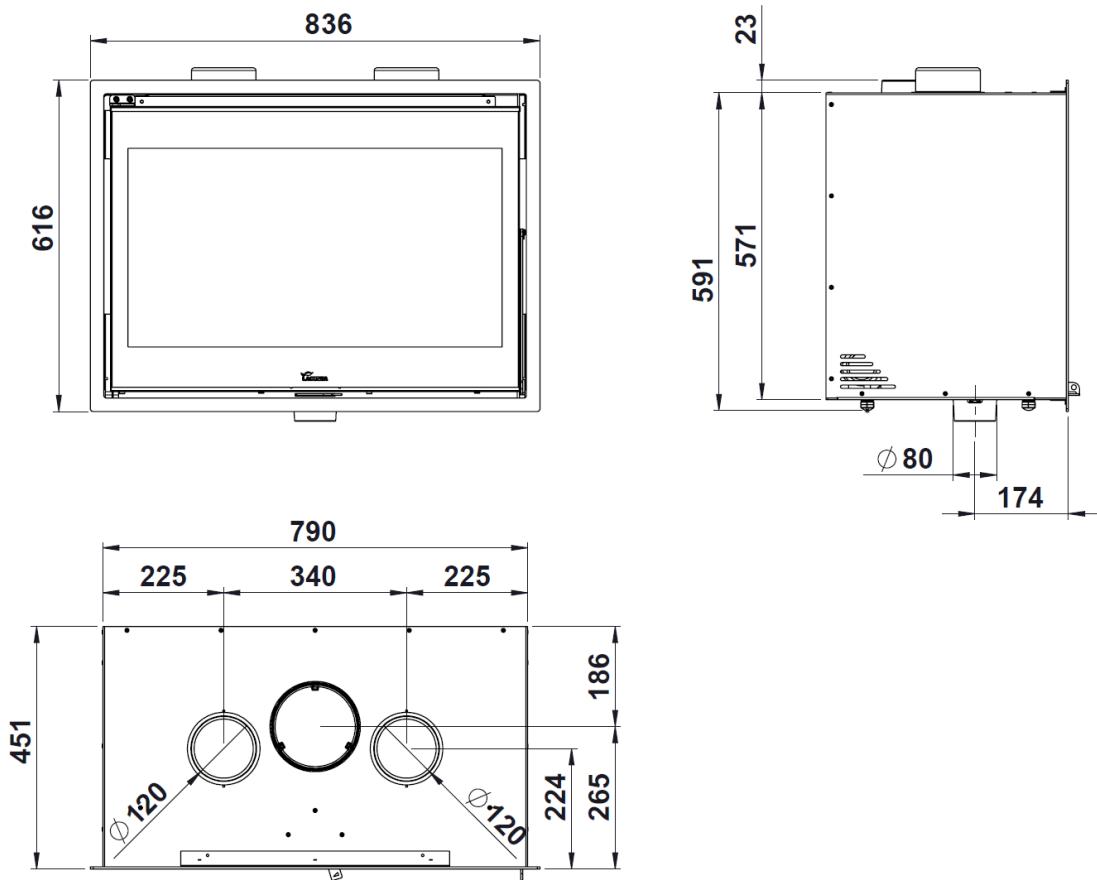

Figure No.2 - Dimensions of the LOIRE 800 appliance in mm

2. INSTRUCTIONS FOR THE INSTALLER

2.1. Warning to installers

All local and national regulations, including all those referring to national and European standards, must be observed when installing the appliance.

Installation of the appliance must be performed by an authorised installer.

An incorrectly installed appliance may lead to serious incidents (fires, creation of harmful gases, deterioration of nearby fixtures, etc.).

Lacunza's liability is limited to the supply of the material and does not include installation of the appliance.

2.2. Room for installation

2.2.1. Ventilation of the room

The appliance needs to consume oxygen (air) in order to work properly. Ensure a suitable air supply in the room in which the appliance is fitted. This quantity of oxygen is additional to the oxygen that we need in order to breathe (air renewal).

In order to ensure the high quality of the air you breathe and to avoid potential accidents resulting from high concentrations of the gases produced by combustion (mainly carbon dioxide and carbon monoxide), it is absolutely crucial to ensure the suitable renewal of the air in the room in which the appliance is fitted.

the room must always have at least two permanent grilles or openings to the exterior in order to renew the air (one for intake and the other for extraction).

For the installation of its appliances, Lacunza recommends an additional section for these openings. One of these two grilles must be situated high up in the room (at less than 30 cm from the ceiling)

and the other one low down (at less than 30 cm from the floor). Both grilles must open outdoors in order to renew the air in the room with fresh air.

The minimum section that each of these grilles must have depends on the nominal output of the appliance in accordance with the following table:

| Output of the appliance (kW) | Minimum additional section of each of the grilles (cm ²) |
|------------------------------|--|
| P ≤ 10kW | 70 |
| 10 < P ≤ 15 | 90 |
| 15 < P ≤ 20 | 120 |
| 20 < P ≤ 25 | 150 |
| 25 < P ≤ 30 | 180 |
| 30 < P ≤ 35 | 210 |
| P > 35 | 240 |

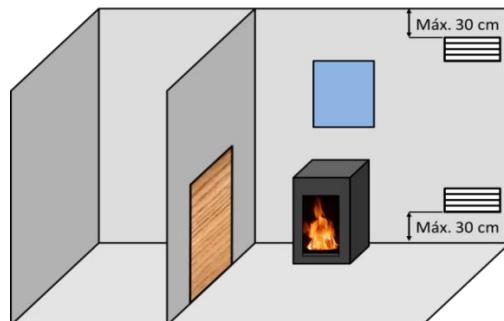

Figure No.3 - Guideline indications for ventilation grilles

The appliance must always be used with the door(s) closed.

In rooms equipped with Controlled Mechanical Ventilation, the system extracts and renews the ambient air; in such cases, the room is at slightly low pressure and it is necessary to install a non-closable outside-air inlet with a section of at least 90 cm².

2.2.2. Location of the appliance in the room

Choose a location in the room which favours good hot-air distribution by convection and radiation.

2.3. Installation of the appliance

2.3.1. Floor

Make sure that the base can withstand the total constructed weight of the appliance and its casing.

When the floor surface (base) is combustible, fit suitable insulation.

2.3.2. Safety distances

Be sure to respect the appliance installation distances from **combustible materials**. Looking at the appliance head-on:

| | Distance to combustible materials (mm) |
|--------------------------|--|
| From the right-hand side | 400 |
| From the left-hand side | 400 |
| From the rear | 400 |
| From the front | 1100 |

Bear in mind that it may even be necessary to protect non-combustible material in order to prevent breakage, deformation, etc., as a result of overheating if the non-combustible material is not designed to withstand high temperatures.

2.3.3. Checks before lighting for the first time

- Make sure that the glass is not broken or damaged.
- Make sure that the flueway is not obstructed with packing or loose parts.
- Make sure that the airtight joints on the flue circuit are in perfect condition.

- Make sure that the doors close properly.
- Make sure that all moving parts are fitted in place.
- Check that the deflector is fitted properly

2.3.4. Height adjustment and levelling the appliance

The appliance must be perfectly level, horizontally and vertically, both at the front and on the sides (use a spirit level).

The appliance has adjustable legs with which to adjust its height.

The legs can be adjusted using a 24mm spanner.

2.3.5. Casing

Make sure that the material around the appliance is not flammable or likely to deteriorate as a result of heat (wallpaper, carpet, plastic-based casing, Silestone, etc.).

The image below gives an example of how the appliance can be encased properly:

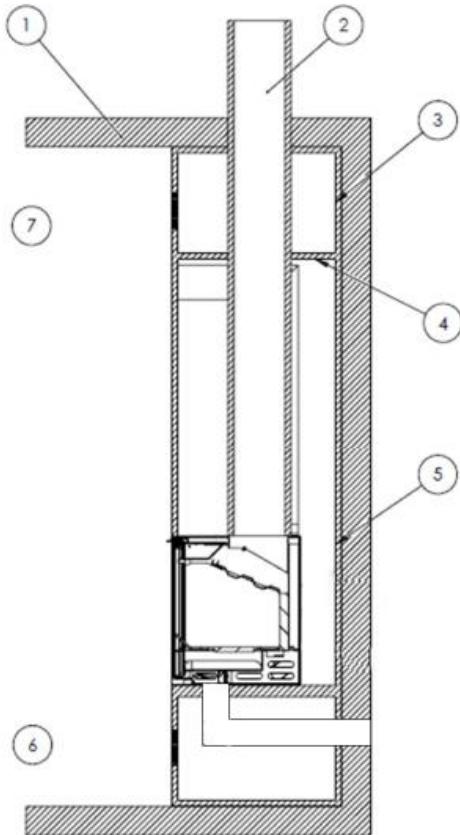

Figure No.4 - *Interior diagram of the casing*

Key to casing diagram:

- 1 Ceiling
- 2 Flue
- 3 Incombustible material (Inner hood insulation)
- 4 Insulating deflector made of incombustible material
- 5 Wall
- 6 Fresh-air inlet ($1,000 \text{ cm}^2$)
- 7 Hot-air outlet ($1,000 \text{ cm}^2$)

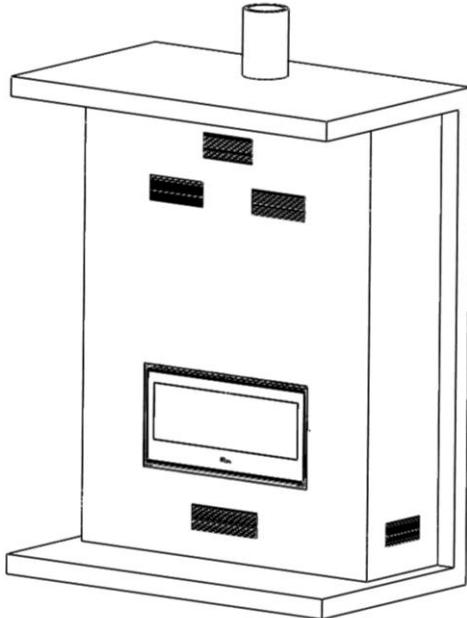

Figure No.5 - *Exterior diagram of the casing*

In order to enable suitable air circulation and correct operation, the casing must have a fresh-air inlet with a minimum section of $1,000 \text{ cm}^2$ beneath the level of the actual appliance and a hot-air outlet measuring at least $1,250 \text{ cm}^2$ above it (just before the insulating deflector inside the casing). These inlet and outlet sections must ensure air renewal in such a way as to avoid damage to parts inside the hood due to excess temperature.

This specification must be observed regardless of the type of installation chosen (with or without forced ventilation, combustion air from indoors or outdoors, directed hot-air outlets with or without pipes, etc.). A further hot-air ventilation grille is also recommended between the insulating deflector on the hood and the ceiling.

As well as this, the hood/closure should have a free opening of at least 100 cm^2 for the intake of air for combustion.

Warning: on appliances on which it is possible to pipe air to the firebox, the hood requires a further air inlet at the bottom, in addition to the 1,000cm² inlet, if the air supply comes from the room in which the appliance is fitted.

On non-central-heating appliances (without back boiler), Lacunza does not recommend enveloping the outside of appliances with insulation.

Never completely block off the lateral ventilation grilles of the fairing.

The installer must fit the necessary inspection accesses (trap doors, hatches, etc.) so that everything inside the hood that may need maintenance work or replacement can be accessed at any time.

2.3.1. Preparing the outside air connection

On this model, it is possible to pipe air to the appliance for combustion straight from outdoors. We recommend that, if possible, air be drawn from outdoors for combustion via a non-closable pipe with a diameter of 80mm leading to the nozzle on the bottom-front of the appliance.

If the tube is straight, it can have a maximum of 12 meters in length. If you use accessories like elbows, you must subtract the total length (12 meters) 1 meter for each accessory used.

This is the best option because it means that draughts are not created in and oxygen is not consumed from the room in which the appliance is fitted. A further advantage is that there is no danger of downdraught which may hinder the correct updraught of the appliance when an extractor or mechanical ventilation appliance is used in the same room as the central-heating appliance or in another one alongside it.

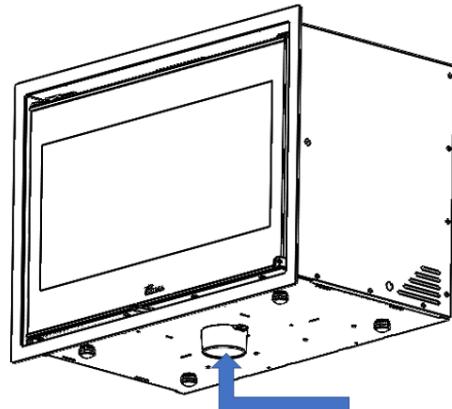

Figure No.6 - Air conduction for the combustion chamber

If this is not possible, ensure that the appliance receives air for combustion.

The device has an accessory to channel the air inlet from the rear. This accessory is NOT shipped as standard with the device.

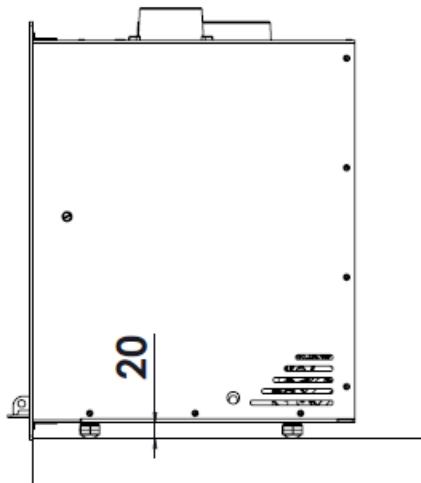

Figure No.7 - Accessory to channel the air inlet from the rear

Outside air connection via the wall

1. Make an opening in the wall (see the measurements of the appliance on the section 1.1 to see the exact position of the hole).
2. Close the air connection hermetically to the wall.

Attention: The legs that ensure the proper distance between the base and

the appliance can not be removed. This must be greater than 20 mm.

2.3.2. Connection to the flue

The appliance must be connected to the chimney flue using special piping designed to resist the products of combustion (e.g. stainless steel, enamelled steel, etc.).

To connect the flue to the socket flange, insert the piping inside the flange and seal the joint with fire sealant or fire cement to make it completely airtight.

The installer must ensure that the pipe connected to the appliance is well secured and there is no chance of it coming free from its housing (e.g. as a result of dilatation due to temperature, etc.).

On this appliance, the flue socket can be fitted on top of the appliance.

2.3.3. Piping air to other rooms

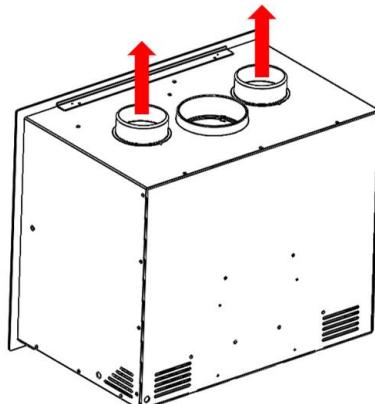

It is possible to pipe some of the heat generated to other rooms in the house using the appliance. This does not mean that the appliance works more efficiently, but it does mean that the heat it creates is distributed better. For this purpose, in the top surface of the appliance there are 2 potential hot-air outlets with diameters of 120mm on the top shell of the appliance.

Pipes can be fitted from these outlets to other rooms. If you intend to do this, bear the following points in mind.

- The air ducts must always be heat insulated and smooth inside (not corrugated).
- The pipes must always have an upward slant to facilitate movement by air density.
- On routes with a lot of load loss (a lot of retention), air movement can be forced along the ducts using a motor or fan, provided that it is designed to withstand such temperature conditions.

Bear in mind that air ducts mean that noise travels more easily from one room to another.

The following table shows the heat output of the air from the hot-air outlets with the appliance working at Nominal Heat Output:

| | Output (kW) |
|-----------|-------------|
| LOIRE 700 | |
| LOIRE 800 | |

Figure No.8 - Table showing heat output of the air leaving the appliance

Note: The values shown in the above table were measured at the appliance

output point and based on tests performed at nominal heat output and maximum fan speed.

All hot-air ducts lose heat, meaning that the heat output obtained at the end of piping always depends on its design.

The appliance LOIRE there are 2 potential hot-air outlets with diameters of 120 mm on the top shell of the appliance.

1º Turn the piece from the back of the circle as seen in the images.

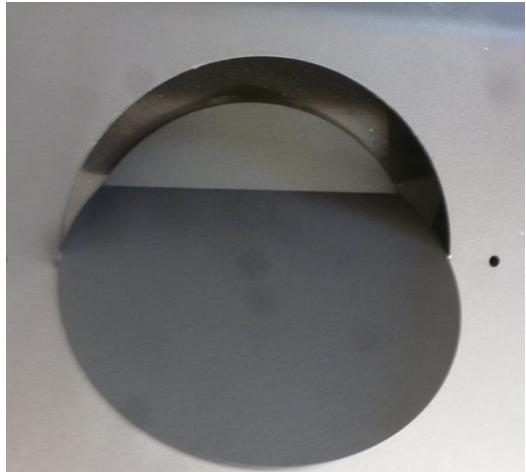

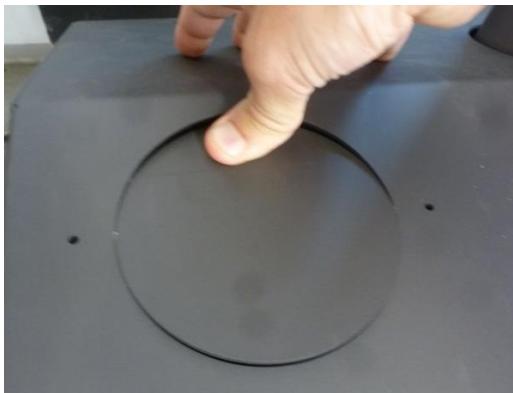

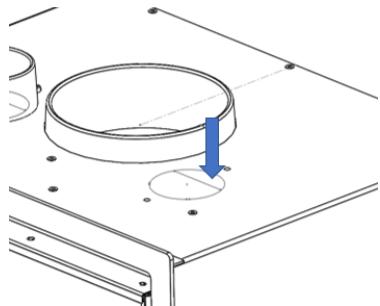

Figure No.9 - Push as indicated by arrow

This favors the movement of air into the air outlet

2º Place the nozzle into position.

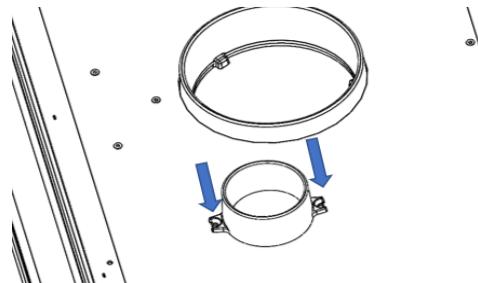

Figure No.10 - Screw the nozzle.

2.3.4. Exterior Frame. Removal and assembly

To fit the frame, proceed as follows:

- Bend all the tabs located in the upper and lower part of the frame, as shown in the picture.

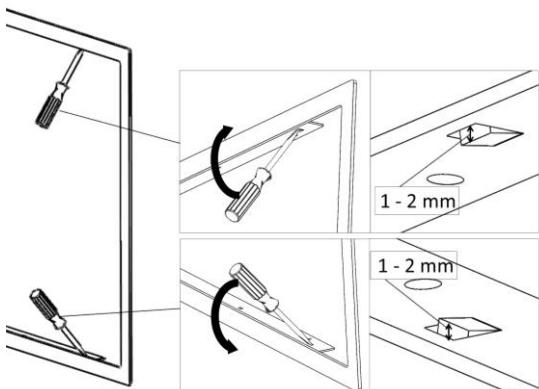

Figure No.11 - *Bending the tabs*

- Insert the frame in the appliance pressing.

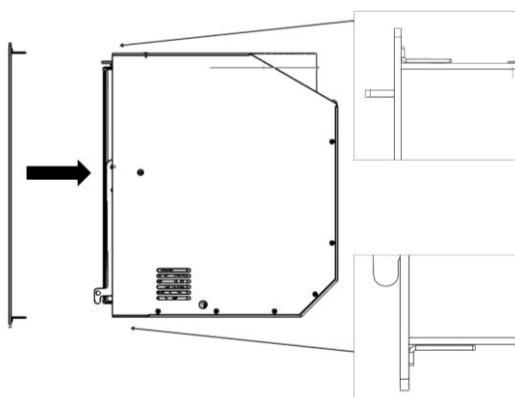

Figure No.1 - *Insert frame in the appliance*

- To remove the frame, perform the same operation in reverse order.

2.3.5. Turbine-potentiometer connection

These are the connection instructions in order to control the ventilator system using the supplied potentiometer.

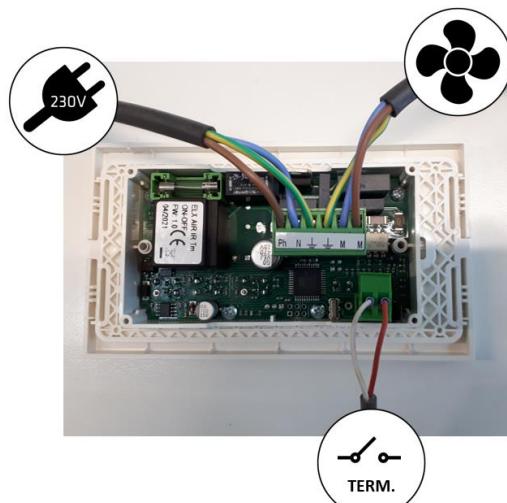

Figure No.1 - *Connections to be carried out in the potentiometer*

WARNING: the operating temperature of the potentiometer supplied by Lacunza is from 0 to 40°C. Particular care should be taken when choosing where it will be positioned so that it is not damaged by temperatures above 40°C. Insulate the potentiometer correctly so as to avoid this problem.

Read the potentiometer instruction manual.

2.4. Chimney flue

The chimney flue must comply with present standards on the installation of chimneys.

In rooms equipped with Controlled Mechanical Ventilation, the ventilation outlet must never be connected to the flue.

The appliance must always have its own chimney flue, never sharing a chimney flue with another appliance.

2.4.1. Type of flue

The flue must be made of special material designed to resist the products of combustion (e.g. stainless steel, enamelled steel, etc.).

Non-central-heating appliances (without back boiler) require an insulated, double-sleeve flue only on those sections that run outdoors or through cold areas. Single piping can be used inside the building, the heat of the gases serving to heat rooms, insulating only those sections where excess temperature may cause damage.

If the chimney is constructed, then it is necessary to pipe and insulate it to ensure correct updraught.

The diameter of the pipe must be the same as the diameter of the flue socket on the appliance over its entire length in order to ensure correct operation.

The flue must prevent the entry of rainwater.

The flue must be clean and airtight over its entire length.

The flue must be at least 6m tall and the chimney cap must not hinder the free release of gases.

If the flue tends to suffer from downdraught, then it is necessary to fit an effective anti-downdraught cowl, a static cowl or a smoke extraction fan, or reshape the chimney.

Never make 90° bends, due to the great loss of draught they cause, and reduce 45° bends down to an absolute minimum. Each 45° bend is equivalent to a 0.5m reduction in flue length. Horizontal flue sections should not be installed because they cut updraught a great deal.

If the flue draws at more than 20 Pa on 12Pa appliances, then an effective damper must be fitted on the flueway. This damper must be visible and accessible.

The chimney flue must not rest on the appliance.

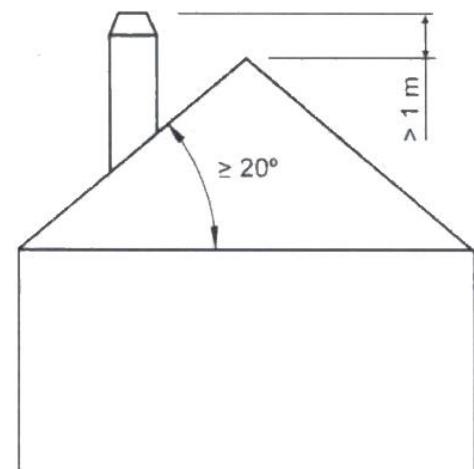

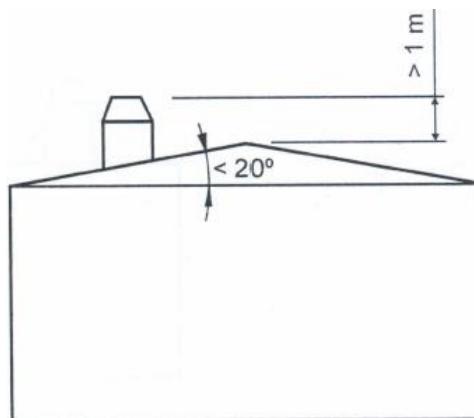

Bear in mind that high temperatures may be reached in the flue, meaning that it is essential that insulation be enhanced in sections in which combustible material

is present (wooden beams, furniture, etc.). It may even be necessary to protect non-combustible material in order to prevent breakage, deformation, etc., as a result of overheating if the material is not designed to withstand high temperatures.

It must be possible to clean the entire flue, no sections being left inaccessible for cleaning purposes.

2.4.2. Chimney crown

The upper end of the chimney must clear the roof, the roof ridge or any obstacle located on the roof by at least 1m.

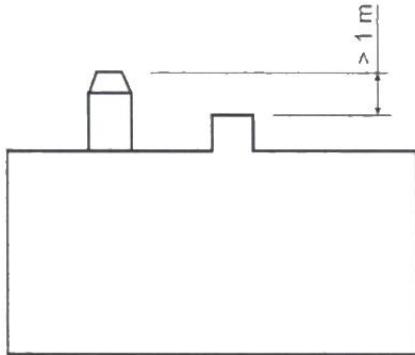

Figure No.2 - *Distances between chimney crown and roof ridge*

The chimney crown must clear the highest point of any neighbouring building or obstacle located within a 10m radius of the chimney outlet by more than 1m.

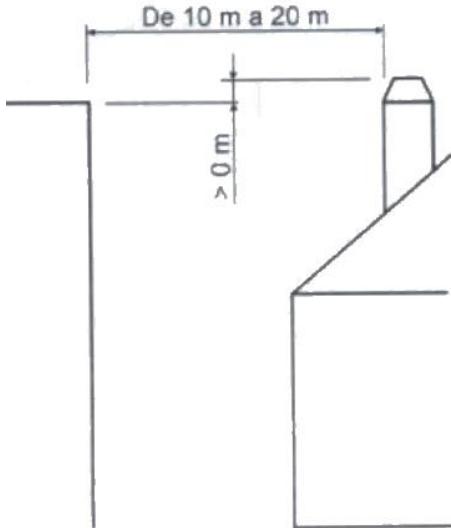

Figure No.4 - *Distances between the chimney crown and objects within a radius of between 10 and 20m*

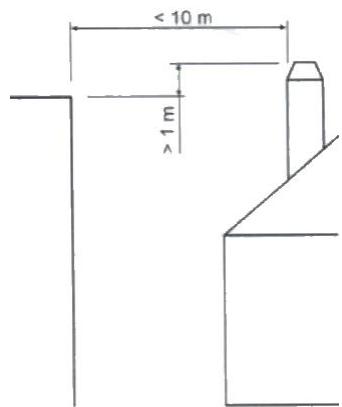

Figure No.3 - *Distances between the chimney crown and objects within a 10m radius*

The chimney crown must clear any neighbouring building or obstacle located within a radius of 10m to 20m from the chimney outlet.

3. INSTRUCTIONS OF USE

The manufacturer accepts no liability whatsoever for damage caused to parts as a result of the improper use of non-recommended fuels, modifications made to the appliance or how it is installed. **Only use original replacement parts.**

All local and national regulations, including those referring to national and European standards, must be observed when using the appliance.

Heat is diffused by radiation and convection via the front and exterior of the appliance.

3.1. Fuel

This appliance must not be used as an incinerator. Do not use non-recommended fuels.

- Use dry logs (max. 16% humidity), cut at least 2 years ago, clean of resin and stored in a sheltered, ventilated place.
- Use hard woods with high calorie values and good ember production.
- Large logs should be cut to useable lengths before being stored. The logs should have a maximum diameter of 150mm.
- Finely-chopped wood produces greater heat output, but also burns more quickly.

Optimum fuels:

- Beech.

Other fuels:

- Oak, chestnut, ash, maple, birch, elm, etc.
- Pine and eucalyptus logs are low density and produce very long flames, and may cause the parts of the appliance to wear out more quickly than normal.

- Resinous wood may mean that the appliance and the flue need to be cleaned more often.

Non-permitted fuels:

- All types of coal and liquid fuel.
- "Green wood". Green or damp wood reduces the performance of the appliance and leads to soot and tar build-up on the inner walls of the flue, obstructing it.
- "Recovered wood". The burning of treated woods (railway sleepers, telegraph posts, plywood, fibreboard, pallets, etc.) quickly blocks the system (soot and tar build-up), harms the environment (pollution, smells) and may lead to deformation of the firebox due to overheating.
- All materials which are not wood (plastic, spray cans, etc.).

Green and reprocessed wood may cause chimney fires.

The graph below shows how the humidity of firewood affects its heat output:

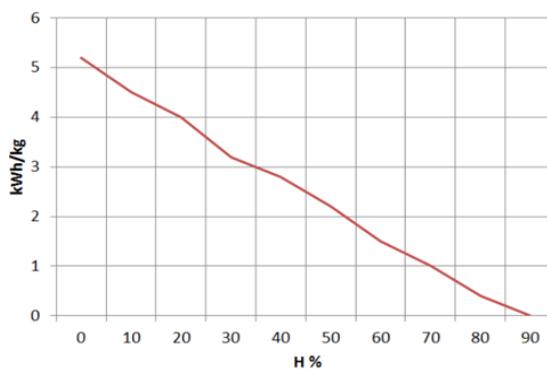

Figure No.5 - Relationship between firewood humidity and heat output.

3.2. Description of the parts of the appliance

3.2.1. Operating components

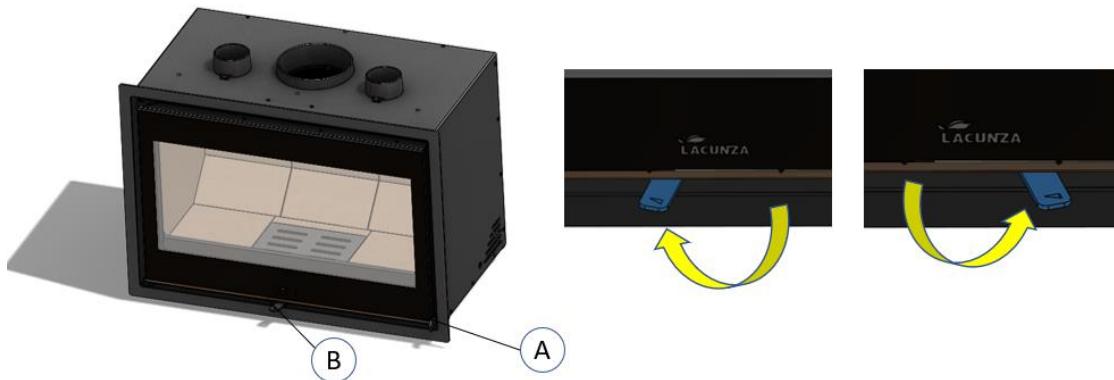

Figure No.6 - *Operating components on the appliance*

- A: Firebox door handle
- B: Air intake
 - B1 Closed (left)
 - B2 Opened (right)

3.3. Lighting

Use of the appliance in warm weather (warm days, early hours of the afternoon on sunny days) may lead to lighting and updraught problems.

Certain weather conditions, such as fog, ice, humidity entering the flue, etc., may hinder sufficient updraught in the flue and lead to suffocation.

Proceed as follows in order to light the appliance satisfactorily:

- Open the firebox door(s) and open all the firebox air-intake inlets to the full.
- Place paper or a firelighter and some wood chips in the firebox.
- Light the paper or firelighter.

- Leave the door slightly ajar, the width of two or three fingers, for about 15 minutes until the glass warms up.

3.4. Loading fuel

In order to load firewood, open the firebox door gently, preventing the sudden entry of air to the firebox so that smoke does not enter the room that the appliance is installed in. Perform this operation with the glove to prevent burns to the hands.

The maximum load height is 2 logs with diameters of approx. 10 cm.

The minimum interval between loads for nominal heat output is 60 minutes.

Always load with the nominal amount (see table in section 1.1).

For minimum burning (e.g. at night), use thicker logs.

When the firebox is loaded, close the door.

Be careful when placing logs in the firebox on appliances with vermiculite interiors. Vermiculite is a fragile material and may crack if knocked.

In order to obtain maximum output, open all the air intakes to the firebox and in order to obtain minimum output, tend towards closing them. For normal use, we recommend leave the Secondary open.

IMPORTANT: The appliance is exposed to extreme changes in temperature and may, as a result, make noises when in operation. These noises are a natural result of expansion/contraction of the parts which make up the appliance. Do not be alarmed by noises of this kind.

3.5. Operation

The appliance should be operated with the door closed.

For safety reasons, never close all the appliance's combustion-air intakes.

Primary-air intake

By opening this inlet, air enters the firebox via the firebox grille.

Secondary-air intake

By opening this inlet, air enters the firebox via the top of the firebox door.

IMPORTANT: Keeping the secondary-air intake open helps keep the door glass cleaner for longer.

Double-combustion air intake

By opening this inlet, air enters the combustion flame, making for more efficient and less polluting combustion because post-combustion takes place, burning the particles which were not burned in the first combustion. This increases the performance of the appliance and reduces emissions.

3.6. Removing ash

Following sustained use of the appliance, it is necessary to remove the ash from the firebox. Remove the ashpit box when cold or using something to prevent yourself from getting burned (glove).

Never throw hot embers into the rubbish.

Access the ashpit by opening the door on the appliance.

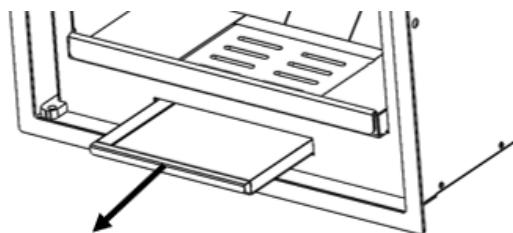

Figure No.7 - Remove ashpit.

Warning! It is very important to put the ashpit back in its housing at the bottom of the firebox after emptying it of ashes and before lighting the fire again! Do this by following the extraction process in reverse order.

3.7. Deflectors

The appliance has 2 deflectors.

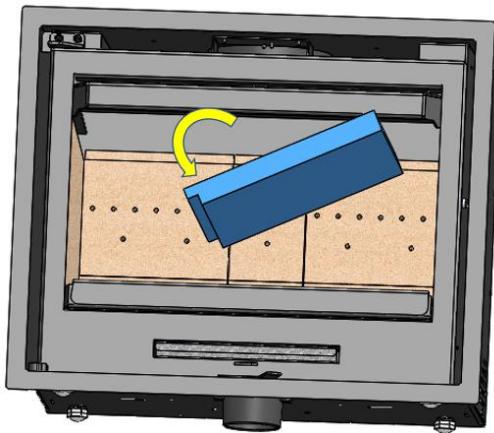

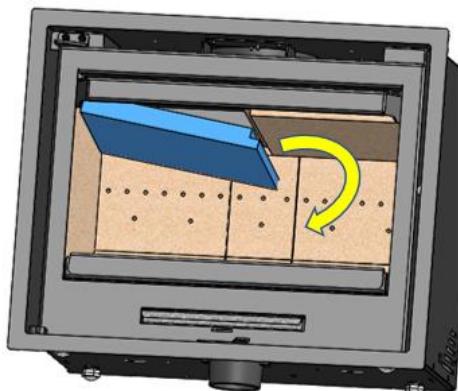

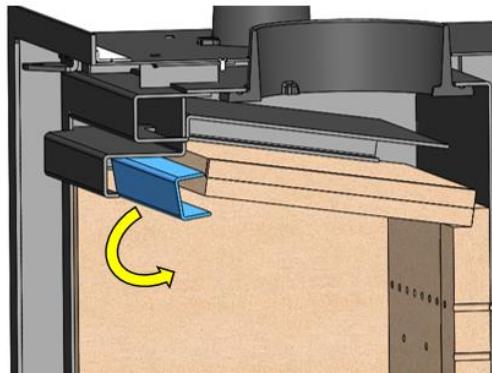

Figure No.8 - *Dismantling the LOIRE vermiculite deflector*

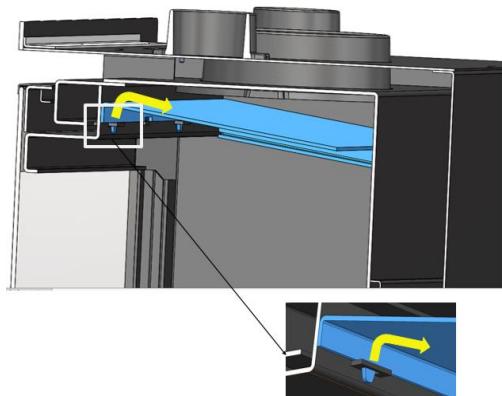

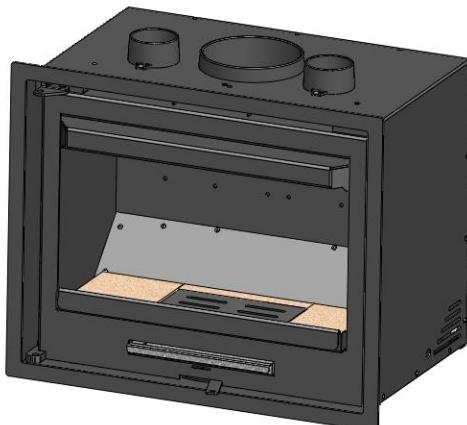

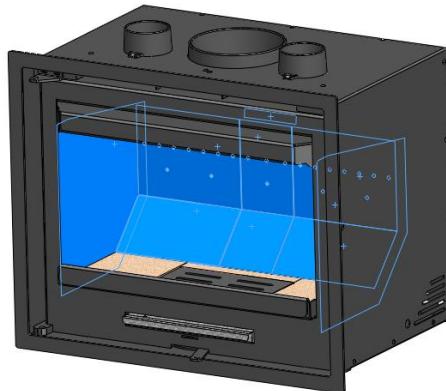

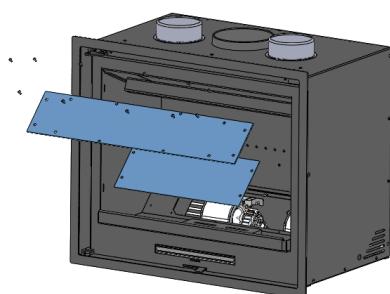

Figure No.9 - *Dismantling the LOIRE steel deflector*

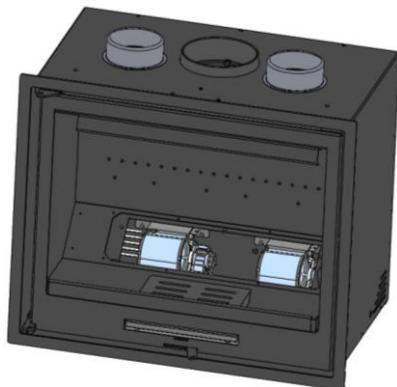

3.8. Access to fans

To access the fans we will have to remove the vermiculite coating from the interior of the home and release the two covers that are inside as seen in the image.

(rotating wheel) and stops automatically when the temperature drops beneath 50°C.

For more information see the potentiometer instruction manual.

3.9. Electrical system

Forced convection. Fans

LOIRE models have 1 fan for the forced convection of the hot air generated around the appliance inside the shell. This air can be piped to other rooms.

IMPORTANT: This appliance is not covered by our warranty unless directly connected to the mains electricity supply in accordance with the conditions described in the relevant section in 1.1.

Potentiometer operation:

By means of its rotating lever, the potentiometer controls the flow of hot-air output from the appliance in two ways:

- **Automatic mode:**

The fan automatically starts working at the set speed via the thermostat. When a fire has been lit in the firebox and the thermostat reaches a temperature of approximately 50°C, the fan starts working at the power set on the potentiometer

4. MAINTENANCE AND IMPORTANT ADVICE

4.1. Maintenance of the appliance

The appliance, the flue connector piping and the flue must be cleaned regularly, particularly following long periods without use.

4.1.1. Firebox

Clean the firebox area of ash, etc.

4.1.2. Inside the appliance

Clean the firebox area of ash. Clean the deflectors, where soot may build up.

4.1.3. Flue socket

The flue socket area must be kept clean at all times for the appliance to work properly.

It must be cleaned as often as required. How often it is cleaned depends on how much the appliance is used and the type of fuel employed.

4.1.4. Firebox glass

Keep the secondary-air intake open to keep the door glass cleaner for longer. However, the glass may get dirty the longer the appliance is used. Special degreasing products designed for the purpose should be used to clean it.

Clean when the glass is cold and taking care not to apply the glass cleaner directly onto the glass as it could come into contact with the door-seal cord and damage it.

4.1.5. Painted sheet-steel-cast-iron parts.

These parts should be cleaned with a brush or dry cloth. Do not dampen the parts: the steel could rust and the paint could blister and chip. Be particularly

careful when cleaning the glass: the liquids used must not dampen the painted steel.

4.1.6. Electrical system

The electrical system should be cleaned-vacuumed regularly (depending on the installation and use), so as to avoid the accumulation of ash, lint and other remains that may generate strange noises and/or deteriorate the ventilators and electrical system. Disconnect the electrical network system to perform this task.

4.1.7. Air intake registers

In the air intake for combustion registers, remains of ash, sawdust, cleaning fluids, etc. may accumulate, which restrict or hinder its movement. In these cases, they should be released and cleaned.

4.2. Maintenance of the chimney flue

VERY IMPORTANT: In order to avoid incidents (chimney fires, etc.), it is necessary to perform maintenance and cleaning operations on a regular basis; if the appliance is used often, then the chimney and the flue connector piping must be swept several times a year.

In the event of fire in the chimney, close the flue draught, close doors and windows, remove embers from the firebox, block the connection hole with damp cloths and call the fire brigade.

4.3. Important advice

Lacunza recommends that only Lacunza-authorised replacement parts be used.

Lacunza accepts no liability for any modification to the product which it has not authorised.

This appliance is a heat-producing appliance and contact may lead to burns.

This appliance may remain HOT for a period of time after it has gone out. MAKE SURE THAT SMALL CHILDREN DO NOT GO NEAR IT.

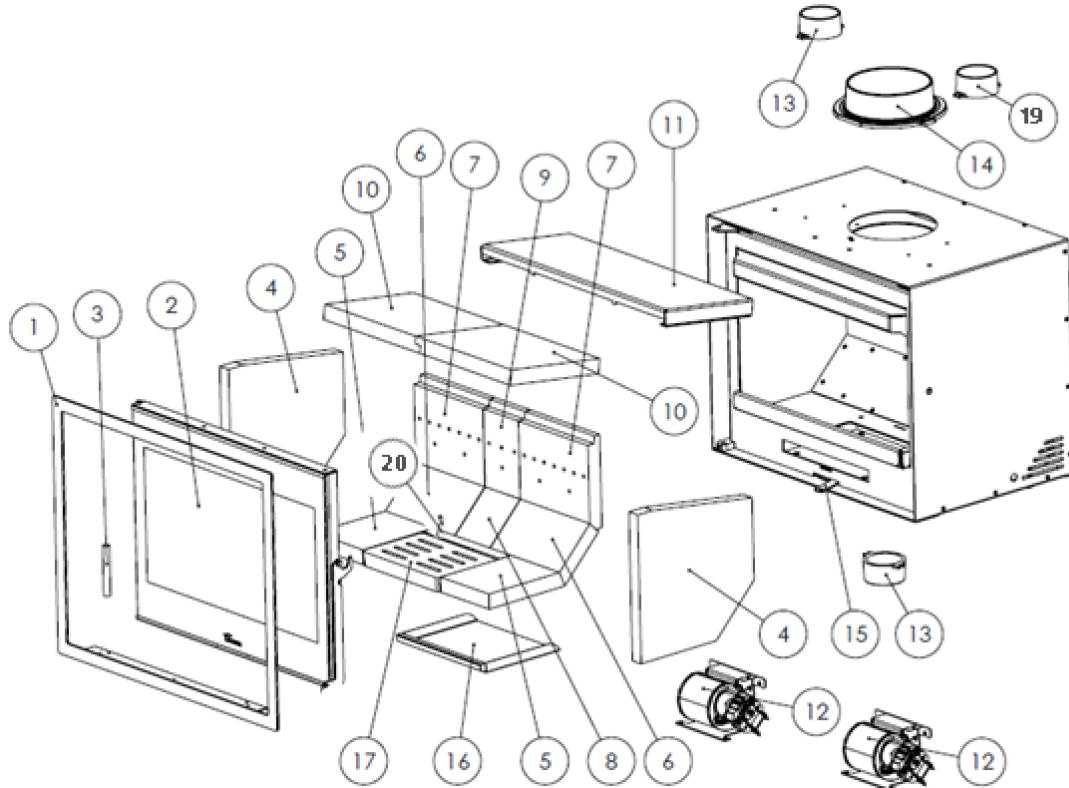

5. TROUBLESHOOTING

This symbol means that a qualified professional should be called to perform the operation.

| Problem | Probable causes | Solution |
|---|-----------------------------|--|
| The fire does not light properly The fire does not stay alight | Green or damp wood | Use hard woods, cut at least 2 years ago and stored in a sheltered, ventilated place |
| | The logs are too large | Use crumpled paper or firelighters and dry wood chips to light the fire. Use split logs to keep the fire going |
| | Poor-quality wood | Use hard woods which produce heat and embers (chestnut, ash, maple, birch, elm, beech, etc.) |
| | Insufficient primary air | Open the primary- and secondary-air intakes completely, or even open the door slightly. Open the outdoor-air inlet grille |
| | Insufficient updraught |  Check that the draught is not blocked. De-soot if necessary. Check that the flue is in perfect condition (airtight, insulated, dry, etc.) |
| The fire flames up too much | Excessive primary air | Close the primary- and secondary-air intakes partially or totally |
| | Excessive updraught |  Install a draught damper |
| Smoke given off on lighting | Poor-quality wood | Do not continually burn chips, carpentry scraps (plywood, pallets, etc.) |
| | Cold flue | Heat up the flue by burning a piece of paper in the firebox. |
| Smoke during burning | The room is at low pressure | In rooms with Controlled Mechanical Ventilation, leave an outdoor window ajar until the fire is fully alight. |
| | Too little wood loaded | Load as recommended. Loads notably smaller than those recommended lead to low smoke temperature and downdraught. |
| | Insufficient updraught |  Check the condition of the flue and insulation. Check that the piping is not blocked. Clean mechanically if necessary |
| | Wind enters the flue |  Install an anti-downdraught system (Cowl) at the top of the chimney |
| Does not warm up enough | The room is at low pressure |  In rooms with Controlled Mechanical Ventilation, there must be an outdoor-air inlet |
| | Poor-quality wood | Only use the recommended fuel |
| The fans do not work | Electrical fault |  |
| Water condenses (after the appliance has been lit more than 3 or 4 times) | Too little wood loaded | Load as recommended. Loads notably smaller than those recommended lead to low smoke temperature and condensation. |
| | Green or damp wood | Use hard woods, cut at least 2 years ago and stored in a sheltered, ventilated place. |
| | Condition of the flue | Lengthen the flue (5-6 metres minimum). Insulate the flue properly. Check the airtightness of the flue/appliance. |

DECLARACIÓN DE PRESTACIONES Conforme al R. E. Productos Construcción (UE) № 305/2011
DÉCLARATION DE PERFORMANCE Selon le Réglement (UE) № 305/2011
DICHIARAZIONE DI PRESTAZIONE In base al Regolamento (UE) № 305/2011
DECLARATION OF PERFORMANCE According to Regulation (UE) № 305/2011
DECLARAÇÃO DE PRESTAÇÕES Em base com o Regulamento (UE) № 305/2011

1. Nombre y/o código de identificación única del producto:
Nom-code d'identification unique du produit
Nome-codice identificativo unico del prodotto
Unique identifier nome-code for product
Nome-código de identificação único do produto
 - Marca, marque, marca, mark, marca: **Lacunza**
 - Tipo, type, tipo, type, tipo: **Insertable, Appareil insérable, Apparecchio a incasso, Insertable appliance, Aparelho encastrável**
 - Modelo, modèle, modello, model, modelo: **LOIRE 700**
2. Uso o usos previstos del producto: Aparato insertable de carga manual, para quemar combustibles sólidos (indicado en instrucciones), cuya función es calentar el espacio en el que está instalado.
Utilisation prévue du produit: Appareil insérable qui se charge manuellement, conçu pour brûler des combustibles solides (indiqués dans le Manuel d'Instructions), dont la fonction est de chauffer l'espace où il est installé.
Usi previsti del prodotto: Apparecchio a incasso a carico manuale, per bruciare combustibili solidi (indicati nelle istruzioni), la cui funzione è riscaldare lo spazio in cui è installato.
Extended uses of the product: Insertable appliance to be loaded by hand and designed to burn solid fuels (indicated in instructions), whose function is to heat the space in which it is installed.
Utilização prevista do produto: Aparelho encastrável de carga manual, para queimar combustíveis sólidos (indicado nas instruções), cuja função é aquecer o espaço no qual está instalado.

Las prestaciones del producto identificado en el punto 1 son conformes con las prestaciones declaradas en el punto 6.

La performance du produit citée au point 1 est conforme à la performance déclarée au point 6.

La prestazione del prodotto di cui ai punti 1 è conforme alla prestazione dichiarata di cui al punto 6.

The performance of the product referred to in point 1 is consistent with the declared performance in point 6.

As declarações do produto identificado no ponto 1, estão conformes com as prestações declaradas no ponto 6.

La presente declaración de prestaciones se emite bajo la única responsabilidad del fabricante, indicado en el punto 3.

Cette déclaration de performance est délivrée sous la responsabilité exclusive du fabricant cité au point 3.

Si rilascia la presente dichiarazione di prestazione sotto la responsabilità esclusiva del fabricante di cui al punto 3.

This declaration of performance is issued under the manufacturer's sole responsibility referred to in point 3.

É emitida a presente declaração de desempenho sob a responsabilidade exclusiva do fabricante referido no ponto 3.
