

SARRIA-SAKAN

Instruction Book

Lacunza congratulates you on your choice.

Certified under ISO 9001, Lacunza guarantees the quality of its appliances and undertakes to meet the needs of its customers.

Confident of the know-how afforded by more than 50 years' experience, Lacunza uses advanced technologies in the design and manufacture of its entire range of appliances. This document will help you install and use your appliance in optimum conditions for your comfort and safety.

1. PRESENTATION OF THE APPLIANCE

For optimum operation of the appliance, we advise you to read this manual carefully before switching on the appliance for the first time. In case of problems or concerns, we urge you to contact your dealer, who will cooperate with you.

In order to improve the product, the manufacturer reserves the right to make changes without notice by updating this document.

This appliance is designed to burn wood in absolutely safe conditions.

WARNING: Faulty installation may have serious consequences.

Installation and all necessary regular maintenance operations must be performed by an authorized installer in full accordance with the specifications set out in the legislation applicable in each country and this instruction book.

1.1. General characteristics

	Unit	Sarria 12	Sarria 16 Sakan 16	Sarria 20 Sakan 20
Operating appliance	-	Intermittent	Intermittent	Intermittent
Appliance classification	-	Type B	Type B	Type B
Preferred fuel	-	Wood logs (Humidity<25%)	Wood logs (Humidity<25%)	Wood logs (Humidity<25%)
Indirect heating functionality	-	YES	YES	YES
Values at Nominal Output	Nominal output to atmosphere (Direct) (P_{nom})	kW	2.5	6.5
	Nominal output to water (Indirect) (P_{Wnom})	kW	12	13
	Nominal output ($P_{nom} + P_{Wnom}$)	kW	14.5	19.5
	Efficiency at P_{nom} (η_{nom})	%	80	81.5
	CO emission at 13% O ₂ at P_{nom} (CO_{nom})	mg/m ³	875	875
	NO _x emission at 13% O ₂ at P_{nom} (NO_{xnom})	mg/m ³	132	117
	OGC emission at 13% O ₂ at P_{nom} (OGC_{nom})	mg/m ³	64	55
	PM emission at 13% O ₂ at P_{nom} (PM_{nom})	mg/m ³	21	35
	Optimum flue draught at P_{nom} (p_{nom})	Pa	12	15
	Gas temperature of flue at P_{nom} (T_{nom})	°C	251	260
	Gas temperature on the flue socket flange at P_{nom}	°C	284	312
	Log load frequency at P_{nom}	h	1	1
	Gas mass flow at P_{nom}	g/s	13.1	16.2
	Wood consumption (beech) at P_{nom}	kg/h	3.8	6.1
Chimney temperature class	-	T400	T400	T400
Maximum admissible water service temperature	°C	90	90	90
Maximum operating pressure (water)	Bar	2.1	2.1	2.1
Back boiler capacity	L	24	34	55
Dimensions of the firebox				
Width	mm	568	568	607
Depth	mm	430	430	410
Useful height	mm	330	330	330
Maximum length of the logs	cm	50	50	60
Volume heated (45W/m ³) at P_{nom}	m ³	322	422	433

Capacity of the ashpit	L	2.5	2.5	2.4
Weight	kg	182	215	220
Flue socket diameter (d_{out})	mm	200	200	200
Type of heat output/room temperature control	Single stage heat output, no room temperature control			
Energy efficiency class	-	A	A	A+
Energy efficiency index (EEI)	-	106	106	108
Seasonal Energy Efficiency of space heating (η_s)	%	70	70	72

Note: The values indicated in the above table are based on tests performed in accordance with, UNE-EN 13229, with logs with no more than 18% humidity and pressure conditions as indicated in each case.

Warning: this appliance is designed and prepared to work with the types of fuel, degree of humidity of the fuel, fuel loads, fuel load frequencies, flue draught and system of installation indicated in this Instruction Book. Failure to respect these conditions may lead to problems with the appliance (deterioration, shorter useful life, etc.) which are not covered by the Lacunza warranty.

SARRIA / SAKAN 12

Figure No.1 - Dimensions of the SARRIA SAKAN 12 appliance in mm

Figure No.2 - Dimensions of the SARRIA SAKAN 16 appliance in mm

Figure No.3 - Dimensions of the SARRIA SAKAN 20 appliance in mm

2. INSTRUCTIONS FOR THE INSTALLER

2.1. Warning to installers

All local and national regulations, including all those referring to national and European standards, must be observed when installing the appliance.

Installation of the appliance must be performed by an authorised installer.

An incorrectly installed appliance may lead to serious incidents (fires, creation of harmful gases, deterioration of nearby fixtures, etc.).

Lacunza's liability is limited to the supply of the material and does not include installation of the appliance.

2.2. Room for installation

2.2.1. Ventilation of the room

The appliance needs to consume oxygen (air) in order to work properly. Ensure a suitable air supply in the room in which the appliance is fitted. This quantity of oxygen is additional to the oxygen that we need in order to breathe (air renewal).

In order to ensure the high quality of the air you breathe and to avoid potential accidents resulting from high concentrations of the gases produced by combustion (mainly carbon dioxide and carbon monoxide), it is absolutely crucial to ensure the suitable renewal of the air in the room in which the appliance is fitted.

the room must always have at least two permanent grilles or openings to the exterior in order to renew the air (one for intake and the other for extraction).

For the installation of its appliances, Lacunza recommends an additional section for these openings. One of these two grilles must be situated high up in the room (at less than 30 cm from the ceiling)

and the other one low down (at less than 30 cm from the floor). Both grilles must open outdoors in order to renew the air in the room with fresh air.

The air inlet grilles must be positioned so that they cannot be blocked or closed accidentally.

The minimum section that each of these grilles must have depends on the nominal output of the appliance in accordance with the following table:

Output of the appliance (kW)	Minimum additional section of each of the grilles (cm ²)
$P \leq 10\text{kW}$	70
$10 < P \leq 15$	90
$15 < P \leq 20$	120
$20 < P \leq 25$	150
$25 < P \leq 30$	180
$30 < P \leq 35$	210
$P > 35$	240

Figure No.4 - Guideline indications for ventilation grilles

The appliance must always be used with the door closed.

In rooms equipped with Controlled Mechanical Ventilation, the system extracts and renews the ambient air; in such cases, the room is at slightly low pressure and it is necessary to install a non-closable outside-air inlet with a section of at least 90 cm².

2.2.2. Location of the appliance in the room

Choose a location in the room which favours good hot-air distribution by convection and radiation.

2.3. Installation of the appliance

2.3.1. Floor

Make sure that the base can withstand the total constructed weight of the appliance and its casing.

When the floor surface (base) is combustible, fit suitable insulation.

2.3.2. Safety distances

Be sure to respect the appliance installation distances from **combustible materials**. Looking at the appliance head-on:

SARRIA SAKAN 12

	Distance to combustible materials (mm)
From the right-hand side	200
From the left-hand side	200
From the rear	200
From the front	1100

SARRIA SAKAN 16

	Distance to combustible materials (mm)
From the right-hand side	200
From the left-hand side	200
From the rear	200
From the front	950

SARRIA SAKAN 20

	Distance to combustible materials (mm)
From the right-hand side	400
From the left-hand side	400
From the rear	400
From the front	1100

Bear in mind that it may even be necessary to protect non-combustible material in order to prevent breakage, deformation, etc., as a result of overheating if the non-combustible material is not designed to withstand high temperatures.

2.3.3. Checks before lighting for the first time

- Make sure that the glass is not broken or damaged.
- Make sure that the flueway is not obstructed with packing or loose parts.
- Make sure that the airtight joints on the flue circuit are in perfect condition.
- Make sure that the doors close properly.
- Make sure that all moving parts are fitted in place.
- Check that the deflectors are fitted properly.

2.3.4. Height adjustment and levelling the appliance

The appliance must be perfectly level, horizontally and vertically, both at the front and on the sides (use a spirit level).

2.3.5. Casing

Make sure that the material around the appliance is not flammable or likely to deteriorate as a result of heat (wallpaper,

carpet, plastic-based casing, Silestone, etc.).

The image below gives an example of how the appliance can be encased properly:

Figure No.5 - Interior diagram of the casing

Key to casing diagram:

- 1 Ceiling
- 2 Flue
- 3 Incombustible material (Inner hood insulation)
- 4 Insulating deflector made of incombustible material
- 5 Wall
- 6 Fresh-air inlet (1,000 cm²)
- 7 Hot-air outlet (1,000 cm²)

Figure No.6 - Exterior diagram of the casing

In order to enable suitable air circulation and correct operation, the casing must have a fresh-air inlet with a minimum section of 1,000cm² beneath the level of the actual appliance and a hot-air outlet measuring at least 1,000cm² above it (just before the insulating deflector inside the casing). These inlet and outlet sections must ensure air renewal in such a way as to avoid damage to parts inside the hood due to excess temperature.

This specification must be observed regardless of the type of installation chosen (with or without forced ventilation, combustion air from indoors or outdoors, directed hot-air outlets with or without pipes, etc.). A further hot-air ventilation grille is also recommended between the insulating deflector on the hood and the ceiling.

The installer must fit the necessary inspection accesses (trap doors, hatches,

etc.) so that everything inside the hood that may need maintenance work, cleaning or replacement can be accessed at any time, e.g. counterweight system, hydraulic components, heating circuit safety components.

2.3.6. Connection to the flue

The appliance must be connected to the chimney flue using special piping designed to resist the products of combustion (e.g. stainless steel, enamelled steel, etc.).

To connect the flue to the socket flange, insert the piping inside the flange and seal the joint with fire sealant or fire cement to make it completely airtight.

The installer must ensure that the pipe connected to the appliance is well secured and there is no chance of it coming free from its housing (e.g. as a result of dilatation due to temperature, etc.).

On this appliance, the flue socket can be fitted on top of the appliance.

2.3.7. Plus Option (Sarria Sakan 12-16)

The firebox is lined with refractory bricks.

Warning! Be particularly careful when loading logs in the firebox because the refractory bricks may crack or break if struck. Lacunza accepts no liability for damage caused to the refractory bricks inside the firebox as a result of incorrect loading.

High temperatures are needed in the firebox in order to keep the refractory bricks clean. Otherwise, they will blacken with use.

2.4. Chimney flue

The chimney flue must comply with present standards on the installation of chimneys.

In rooms equipped with Controlled Mechanical Ventilation, the ventilation outlet must never be connected to the flue.

The appliance must always have its own chimney flue, never sharing a chimney flue with another appliance.

2.4.1. Type of flue

The flue must be made of special material designed to resist the products of combustion (e.g. stainless steel, enamelled steel, etc.).

Central-heating appliances (with back boiler) require a double-sleeve flue, insulated throughout the installation, even inside the building. This prevents the gases from cooling down too much and, consequently, prevents downdraughts, condensation and low top surface and oven temperatures on kitchen stoves.

If the chimney is constructed, then it is necessary to pipe and insulate it to ensure correct updraught.

The diameter of the pipe must be the same as the diameter of the flue socket on the appliance over its entire length in order to ensure correct operation.

The flue must prevent the entry of rainwater.

The flue must be clean and airtight over its entire length.

The flue must be at least 6m tall and the chimney cap must not hinder the free release of gases.

If the flue tends to suffer from downdraught, then it is necessary to fit an effective anti-downdraught cowl, a static cowl or a smoke extraction fan, or reshape the chimney.

Never make 90° bends, due to the great loss of draught they cause, and reduce 45° bends down to an absolute minimum. Each 45° bend is equivalent to a 0.5m reduction in flue length. Horizontal flue

sections should not be installed because they cut updraught a great deal.

The appliance is designed to operate under controlled draught conditions. The appliance must operate at a chimney draught of between 12Pa and 15Pa. To ensure this draught, an automatic draught moderator must be installed in the flue. Uncontrolled draught operation can lead to quick damage of the appliance, which will not be covered by the warranty.

The flue must not rest its weight on the appliance, as this could damage the worktop.

Bear in mind that high temperatures may be reached in the flue, meaning that it is essential that insulation be enhanced in sections in which combustible material is present (wooden beams, furniture, etc.). It may even be necessary to protect non-combustible material in order to prevent breakage, deformation, etc., as a result of overheating if the material is not designed to withstand high temperatures.

It must be possible to clean the entire flue, no sections being left inaccessible for cleaning purposes.

2.4.2. Chimney crown

The upper end of the chimney must clear the roof, the roof ridge or any obstacle located on the roof by at least 1m.

Figure No.7 - Distances between chimney crown and roof ridge

The chimney crown must clear the highest point of any neighbouring building or obstacle located within a 10m radius of the chimney outlet by more than 1m.

Figure No.8 - Distances between the chimney crown and objects within a 10m radius

The chimney crown must clear any neighbouring building or obstacle located

within a radius of 10m to 20m from the chimney outlet.

Figure No.9 - Distances between the chimney crown and objects within a radius of between 10 and 20m

2.5. Water system

IMPORTANT!

Lacunza Kalor Group accepts no liability for damage arising from incorrect connection or connections made by unqualified persons. The connection of the appliance to the heating circuit and the installation of the system must only be performed by professionals duly qualified to do so.

The water system must be connected, and the boiler checked for perfect watertightness, including with the fire lit, before encasing central-heating fireplaces. The water system must be fitted with suitable safety components to prevent potential accidents when a central-heating fireplace is in use. If the installation instructions are not observed, the product warranty is rendered null and Lacunza Kalor Group is excluded from all liability regarding personal injury or damage.

In view of the above, Lacunza Kalor Group accepts no liability for any possible breakage of the casing if the previous obligatory operation checks have not been performed.

2.5.1. Obligatory parts

All water systems involving a Lacunza central-heating appliance must have:

2.5.1.1. Expansion tank

The expansion tank may be open or closed. In either case, the expansion tank must be capable of accommodating the increase in water volume caused by heating. Lacunza recommends systems with closed expansion tanks because then the central-heating fluid does not come into contact with the atmosphere and oxidation problems are greatly reduced.

2.5.1.2. Temperature relief valve

Regardless of the expansion tank employed, the system must include a temperature relief valve set to 97°C. The probe that works the valve must be fitted at the hottest point on the system, i.e. at the point where the hot water leaves the heating appliance. Follow the indications provided in the valve manual. This valve has been individually tested by the manufacturer, who guarantees its watertightness on fitting. If, once activated, it leaks water, this is due to excess water temperature which has deformed the seal or impurities which have embedded themselves in it. These eventualities are not covered by the warranty on the valve

2.5.1.3. Pressure relief valve

When closed expansion tanks are employed, a pressure relief valve set to 3 bar must be fitted to prevent the pressure from exceeding this mark. Follow the indications provided in the valve manual.

2.5.1.4. Automatic fill system

The automatic fill system must be set to 1.2 bar when closed expansion tanks are in use and operate using a ballcock/float mechanism that releases water from the mains supply when the water level falls

beneath the relevant height if an open expansion tank is chosen.

The automatic fill system must be fitted in such a way that it can be triggered at any point in time and can never be closed manually.

2.5.1.5. Circulation pump

A circulation pump must be fitted to make the water flow through the entire water system. We recommend that it be installed on the back-boiler return.

2.5.1.6. Pump on/off thermostat

The circulation pump must be operated by a thermostat that turns the pump on when the water in the central-heating appliance reaches 50°C and turns it off when it falls beneath this temperature. The thermostat must be fitted at the point at which the hot water leaves the appliance.

2.5.1.7. Anti-condensation system

The heating circuit must include an anti-condensation system that ensures that the return water re-enters the central-heating appliance at a temperature above 55°C.

2.5.1.8. Automatic purge valves

As many purge valves as necessary should be fitted at the highest points of the system and areas in which air is likely to accumulate.

2.5.1.9. Circuit drain valve

The system must have a valve with which to drain the circuit at its lowest point.

2.5.1.10. Excess heat discharge

The circuit must have a means by which to discharge excess heat from the back boiler, such as a heat leak radiator, a heat discharge valve, etc.

2.5.1.11. Safety coil

A heat safety device offered as an option on a large part of the Lacunza central-heating appliance range. The arrow on the heat discharge valve that comes included must point towards the appliance and be connected to either of the two male couplings on the coil. The mains water supply is connected directly to this safety valve provided mains pressure is less than or equal to 5bar; if it is higher, then a pressure regulator must be fitted to reduce the pressure to 5bar. The other male coupling on the coil must be connected to the drainage outlet with metal piping. The probe that controls the opening of the heat safety valve must be housed in the bushing nearest to the hot-water output on the appliance. A filter must be fitted prior to the heat discharge valve to prevent impurities from not allowing the valve to close properly.

Lacunza recommends the installation of safety coils on all central-heating appliances that cater for the possibility. Some of their advantages include:

- New water is not released into the water system when coils are activated, meaning that impurities-limescale cannot enter either.
- The overheated water in the back boiler is cooled down by means of the “bain-marie” system.
- The water system cannot be left empty as a result of discharge failure.
- Located at the most efficient position guaranteed (coil+discharge valve).

The manufacturer's instructions must be followed for each of the parts described above.

We recommend that a filter be installed at the mains water input to prevent impurities and foreign bodies from entering the water circuit.

Several connection kits for Lacunza central-heating appliances, which include most of these parts, can be purchased from the Lacunza catalogue to make it easier to install and maintain your appliance.

2.5.2. Relationship between the output of the central-heating appliance and radiator output

It is of the utmost importance that the nominal heat output to water generated by the appliance is proportional to the heat output of the radiators that the appliance runs. Otherwise, one of two things may occur:

The nominal output of the appliance is much higher than the output of the radiators

The entire water system can be heated using less fuel than the nominal load, but the minimum required flue temperature will not be reached, possibly leading to downdraughts, condensation. If, on the other hand, the appliance is fuelled using the nominal load, the system will be unable to accommodate all the output generated, causing safety valves to trip.

The nominal output of the appliance is much lower than the output of the radiators.

The appliance is always forced to work at the upper end of its capacity and is never able to heat the system, leading to low appliance temperature and poor combustion, bringing subsequent smoke and condensation problems.

By way of example, one standard 60cm-wide radiator column/unit has a heat output capacity $\Delta T_{50^{\circ}\text{C}}$ of 143W/unit, meaning that a system involving 100 x 60cm-wide units has a total output of 14.3 kW.

In the example above, possible heat loss resulting from poor insulation of circuit-water pipes is not taken into

account, it being supposed that said pipes are properly insulated. If your system does not have insulated pipes, then this factor should be taken into account in the calculation.

2.5.3. KIT COMBI and BASIC. Combined central-heating appliance + gas/heating-oil boiler installation

There is a Lacunza system available for Lacunza central-heating appliances to be installed as part of water systems in combination with gas/heating-oil boilers which includes most of the parts needed in order to make the connection and automate and run the two systems independently.

2.5.4. Checking the watertightness of the system

The watertightness of the back boiler has been tested in the factory at a pressure of 3.5 bar. Never connect the appliance to the circuit to test the watertightness of the water system and if you do connect it, never perform tests at pressures of more than 3 bar. Lacunza cannot be held liable for the consequences of doing so.

Use the appliance for 15 days before encasing it to ensure there are no leaks on the heating appliance connections.

2.5.5. Connecting the back boiler to the central-heating circuit

Working water pressure: 1.2 bar.

Cold water must always enter the appliance (return) at the bottom and hot water must always leave the appliance to feed the heating circuit (output) at the top.

Figure No.10 - Wrong connection (left) and Right connection (right)

If the appliance offers the possibility to make connections on both sides, these connections must always be diagonal, otherwise the heat output transmitted to the water will be reduced.

Figure No.11 - Incorrect connections (lower thermal output to water).

Figure No.12 - Correct connections

In addition to the flow and return connection fittings on the coil, the appliance has a further 5 connection fittings on the coil.

- Connection (1): 1/2" female fitting for the thermostatic and thermal discharge safety valve probe that Lacunza supplies as an accessory.
- Connection (2): 1/2" female fitting for the thermostatic immersion probe sheath supplied by Lacunza in the KIT COMBI and BASIC accessories. This probe will control the start-stop of the circulator pump in the heating circuit.

- Connection (3): 3/8" female fitting for the automatic air vent. Not supplied with the appliance.

• Connection: If the appliance is fitted with the safety coil inside the coil, there will be 2 1/2" male fittings. The thermal relief valve supplied by Lacunza (see the valve instruction manual) will be connected to one of them, the outlet (4), with the arrow pointing towards the inside of the appliance, so that the coil will be without water while the valve is not operating. To make this connection it will be necessary to insert an adaptor, as the thermal discharge valve has 3/4" female outlets. The other end of the valve, at its inlet, will be connected to the mains water.

- Connection (5): Return of the safety coil circuit to be connected to the drain. Male 1/2" fitting.

Figure No.13 - Connecting fittings

2.5.6. Electrolytic corrosion

We recommend that electrolytic connectors be fitted at the point where the piping connects to the back boiler on all water systems involving non-steel, metal piping.

2.5.7. Guideline water system diagrams

Diagram 1

When the water in the back boiler reaches 50°C, the thermostat (1) trips the circulation pump (10) on until the temperature of the water falls beneath 50°C.

Until the temperature of the water returning from the radiators (5) exceeds 55°C, the anti-condensation valve (6) mixes water leaving the back boiler with water returning from the radiators so that its temperature exceeds 55°C, thereby minimising condensation problems arising as a result of the water system. When the temperature of the water returning from the radiators passes 55°C, the anti-condensation valve opens all the hot-water flow to the radiators.

In the event of overheating or excess pressure, the safety systems (the 97°C heat discharge safety valve (2), 3-bar pressure safety valve (3) and the automatic fill system (7)) come into action to render the system safe.

Diagram 2

When the water in the back boiler reaches 45°C, the thermostat (1) sends a signal to the automatic regulator (11) and the regulator activates the circulation pump (11) until the temperature of the water falls beneath 43°C.

Until the temperature of the water returning from the radiators (5) exceeds 55°C, the anti-condensation valve (6) mixes water leaving the back boiler with water returning from the radiators so that its temperature exceeds 55°C, thereby minimising condensation problems arising as a result of the water system. When the temperature of the water returning from the radiators passes 55°C, the anti-condensation valve opens all the hot-water flow to the radiators.

In the event of overheating or excess pressure, the safety systems (the 97°C heat discharge safety valve (2), 3-bar pressure safety valve (3) and the automatic fill system (7)) come into action to render the system safe.

In this case, the parts inside the rectangle come supplied in the Basic kit. The kit also has an anti-ice protection system and an anti-blockage system to protect the water system when not in use in the summer.

Diagram 3

When the water in the back boiler reaches 45°C, the thermostat (1) sends a signal to the automatic regulator (11), which activates the back boiler circulation pump (10), causing the water to circulate without exchanging heat with the radiator circuit via the plate heat exchanger (13) until the temperature of the water reaches 55°C, at which point the regulator activates the radiator circuit pump, causing heat to be exchanged in the plate heat exchanger and releasing hot water to the radiators.

When the temperature of the water in the back boiler drops below 53°C, the radiator pump stops, and the back boiler pump stops when the temperature falls beneath 43°C.

While the radiators are being heated by the wood-burning appliance, the Combi kit electronic regulator stops the gas/heating-oil boiler from starting up even though the thermostat says that it should in order not to waste boiler fuel. When the water from the wood-burning central-heating appliance drops beneath 48°C, the automatic regulator lets the gas/heating-oil boiler heat the radiators again.

In the event of overheating or excess pressure, the safety systems (the 97°C heat discharge safety valve (2), 3-bar pressure safety valve (3) and the automatic fill system (7)) come into action to render the system safe.

In this case, the parts inside the rectangle come supplied in the Combi kit. The kit also has an anti-ice protection system and an anti-blockage system to protect the water system when not in use in the summer.

Key to water system diagrams:

- 1 50°C pump start thermostat
- 2 97°C heat discharge safety valve
- 3 3-bar pressure discharge safety valve
- 4 Automatic purge valve
- 5 Radiators / heat emitters
- 6 55°C anti-condensation valve
- 7 Automatic fill system
- 8 Drainage outlet
- 9 Closed expansion tank
- 10 Circulation pump
- 11 Automatic regulator
- 12 One-way valve
- 13 Plate heat exchanger

*Note: the heat discharge valve is capable of withstanding a maximum fluid temperature of 110°C.

3. INSTRUCTIONS OF USE

The manufacturer accepts no liability whatsoever for damage caused to parts as a result of the improper use of non-recommended fuels, modifications made to the appliance or how it is installed.
Only use original replacement parts.

All local and national regulations, including those referring to national and European standards, must be observed when using the appliance.

Heat is diffused by radiation and convection via the front and exterior of the appliance.

In the case of central-heating appliances (with back boiler), a large proportion of the heat generated is also diffused by conduction from the appliance to the radiant fluid, i.e. the heating-circuit water.

3.1. Fuel

This appliance must not be used as an incinerator. Do not use non-recommended fuels.

- Use dry logs (max. 16% humidity), cut at least 2 years ago, clean of resin and stored in a sheltered, ventilated place.
- Use hard woods with high calorie values and good ember production.
- Large logs should be cut to useable lengths before being stored. The logs should have a maximum diameter of 150mm.
- Finely-chopped wood produces greater heat output, but also burns more quickly.

Optimum fuels:

- Beech.

Other fuels:

- Oak, chestnut, ash, maple, birch, elm, etc.

- Pine and eucalyptus logs are low density and produce very long flames, and may cause the parts of the appliance to wear out more quickly than normal.

- Resinous wood may mean that the appliance and the flue need to be cleaned more often.

Non-permitted fuels:

- All types of coal and liquid fuel.
- “Green wood”. Green or damp wood reduces the performance of the appliance and leads to soot and tar build-up on the inner walls of the flue, obstructing it.
- “Recovered wood”. The burning of treated woods (railway sleepers, telegraph posts, plywood, fibreboard, pallets, etc.) quickly blocks the system (soot and tar build-up), harms the environment (pollution, smells) and may lead to deformation of the firebox due to overheating.
- All materials which are not wood (plastic, spray cans, etc.).
- Never use gasoline, gasoline-type lamp fuel, paraffin, charcoal lighter fluid, ethyl alcohol or similar liquids to ignite or rekindle a fire in the equipment. Keep all such liquids away from the equipment while it is in use.

Green and reprocessed wood may cause chimney fires.

The graph below shows how the humidity of firewood affects its heat output:

Figure No.14 - Relationship between firewood humidity and heat output.

3.2. Description of the parts of the appliance

3.2.1. Operating components

Figure No.15 - Operating components on the appliance

- A: Firebox door handle
- B: Secondary air intake
 - B1 open (right)
 - B2 closed (left)
- C: Primary air intake
 - C1 open (right)
 - C2 closed (left)
- D: Safety coil
- E: Safety coil probe.

3.3. Lighting

Use of the appliance in warm weather (warm days, early hours of the afternoon on sunny days) may lead to lighting and updraught problems.

Certain weather conditions, such as fog, ice, humidity entering the flue, etc., may hinder sufficient updraught in the flue and lead to suffocation.

Proceed as follows in order to light the appliance satisfactorily:

- Open the firebox door and open all the firebox air-intake inlets to the full.
- Place paper or a firelighter and some wood chips in the firebox.
- Light the paper or firelighter.
- Leave the door slightly ajar, the width of two or three fingers, for about 15 minutes until the glass warms up.
- The first time the appliance is lit, the fire should be gentle to allow the parts of the appliance to dilate and dry.

Important: The first time it is lit up, the appliance may give off smoke and strange smells. This is not a cause for concern. Open an outdoor window to ventilate the room during the first few hours of operation.

If you notice water around the appliance, this is produced by the condensation of the moisture in the wood on lighting the fire. This condensation will no longer appear when the appliance has been lit three or four times and has adapted to its flue. If it does not disappear, then check the flue draught (length and diameter of the flue, flue insulation, airtightness) and the humidity of the wood used.

3.4. Loading fuel

In order to load firewood, open the firebox door gently, preventing the sudden

entry of air to the firebox so that smoke does not enter the room that the appliance is installed in.

Perform this operation with the glove to prevent burns to the hands.

The maximum height of the load shall be approximately one third of the height of the firebox.

The minimum interval between loads for nominal heat output is 60 minutes.

Always load with the nominal amount (see table in section 1.1).

For minimum burning (e.g. at night), use thicker logs.

When the firebox is loaded, close the door.

3.5. Operation

The appliance should be operated with the door closed.

For safety reasons, never close all the appliance's combustion-air intakes.

Primary-air intake

By opening this inlet, air enters the firebox via the firebox grille.

Secondary-air intake

By opening this inlet, air enters the firebox via the top of the firebox door.

IMPORTANT: Keeping the secondary-air intake open helps keep the door glass cleaner for longer.

In class B or BE appliances (without combustion air ducting from the street), when the appliance is not in use, the appliance-flue duct assembly may represent a heat leakage route to the street. When the appliance is not in use, it is advisable to leave the air inlet registers to the combustion chamber closed to minimise these energy losses.

3.6. Removing ash

Following sustained use of the appliance, it is necessary to remove the ash from the firebox. Remove the ashpit box when cold or using something to prevent yourself from getting burned (glove).

Never throw hot embers into the rubbish.

Access the ashpit by opening the door on the appliance.

3.7. Deflectors.

The appliance has 1 (2) deflector/s.

Dismantling the Sarria-Sakan Plus deflector

First remove the lower deflector; lift one side of the deflector until it clears the support on the other side, allow it to drop and extract by pulling towards the front.

Figure No.16 - Dismantling the lower Sarria-Sakan Plus deflector

Then remove the second deflector by drawing it forwards and allowing it to drop at the rear.

Figure No.17 - Dismantling the upper Sarria-Sakan Plus deflector

Soot falling from the flue may build up on the deflector.

Figure No.18 - Section view with two deflectors fitted (Sarria-Sakan Plus)

*Figure No.19 - Section view with two deflectors
fitted (Sarria-Sakan 20)*

4. MAINTENANCE AND IMPORTANT ADVICE

4.1. Maintenance of the appliance

The appliance, the flue connector piping and the flue must be cleaned regularly, particularly following long periods without use.

4.1.1. Firebox

Clean the firebox area of ash, etc.

On central-heating appliances, clean the walls of soot (creosote) in order to enhance performance.

4.1.2. Inside the appliance

Clean the firebox area of ash. Clean the deflectors, where soot may build up.

Clean-scrape the soot (creosote) from the walls of the back boiler to enhance its performance.

4.1.3. Painted sheet-steel-cast-iron parts.

These parts should be cleaned with a brush or dry cloth. Do not dampen the parts: the steel could rust and the paint could blister and chip. Be particularly careful when cleaning the glass: the liquids used must not dampen the painted steel.

4.1.4. Firebox glass

To keep the glass as clean as possible for as long as possible, the secondary air register should be kept open. However, over the hours of use, the glass may become dirty. To clean it, we will use specific degreasing products or dry cleaning products for this task.

The cleaning should be carried out with the glass cold and taking care not to apply the glass cleaner directly on the glass as, if it comes into contact with the door's closing cord, it may deteriorate. Put the cleaning product on the cloth.

It is also important to prevent the cleaning liquid from getting into the moving mechanism of the register, as this could jam it.

Attention, never let the product drip into the lower part of the glass. The accumulation of the cleaning product, with soot or ash residues, can damage the screen printing on the glass.

Note: If we use the appliance in draught conditions higher than 15Pa or burn more wood (per hour) than those indicated in table 1.1, we will subject the appliance to working conditions higher than those designed for it. This can lead to aggressive fouling of the glass (white halo), which cannot be cleaned by the traditional method.

Caution, the vitro ceramic glass is prepared to support 700°C. Never let burning woods or combustion flame beating against the glass for prolonged periods of time. In this case, the glass would be submit to temperatures above 750°C, this could change the internal structure of the glass and make it opaque (irreversible phenomenon).

4.2. Maintenance of the chimney flue

VERY IMPORTANT: In order to avoid incidents (chimney fires, etc.), it is necessary to perform maintenance and cleaning operations on a regular basis; if the appliance is used often, then the

chimney and the flue connector piping must be swept several times a year.

In the event of fire in the chimney, close the flue draught, close doors and windows, remove embers from the firebox, block the connection hole with damp cloths and call the fire brigade.

4.3. Important advice

Lacunza recommends that only Lacunza-authorized replacement parts be used.

Lacunza accepts no liability for any modification to the product which it has not authorized.

This appliance is a heat-producing appliance and contact may lead to burns.

This appliance may remain HOT for a period of time after it has gone out. **MAKE SURE THAT SMALL CHILDREN DO NOT GO NEAR IT.**

5. TROUBLESHOOTING

This symbol means that a qualified professional should be called to perform the operation.

Problem	Probable causes		Solution
The fire does not light properly The fire does not stay alight	Green or damp wood		Use hard woods, cut at least 2 years ago and stored in a sheltered, ventilated place
	The logs are too large		Use crumpled paper or firelighters and dry wood chips to light the fire. Use split logs to keep the fire going
	Poor-quality wood		Use hard woods which produce heat and embers (chestnut, ash, maple, birch, elm, beech, etc.)
	Insufficient primary air		Open the primary- and secondary-air intakes completely, or even open the door slightly. Open the outdoor-air inlet grille
	Insufficient updraught		Check that the draught is not blocked. De-soot if necessary. Check that the flue is in perfect condition (airtight, insulated, dry, etc.)
The fire flames up too much	Excessive primary air		Close the primary- and secondary-air intakes partially or totally
	Excessive updraught		Install a draught damper
Smoke given off on lighting	Poor-quality wood		Do not continually burn chips, carpentry scraps (plywood, pallets, etc.)
	Cold flue		Heat up the flue by burning a piece of paper in the firebox.
Smoke during burning	The room is at low pressure		In rooms with Controlled Mechanical Ventilation, leave an outdoor window ajar until the fire is fully alight.
	Too little wood loaded		Load as recommended. Loads notably smaller than those recommended lead to low smoke temperature and downdraught.
	Insufficient updraught		Check the condition of the flue and insulation. Check that the piping is not blocked. Clean mechanically if necessary
	Wind enters the flue		Install an anti-downdraught system (Cowl) at the top of the chimney
Does not warm up enough	The room is at low pressure		In rooms with Controlled Mechanical Ventilation, there must be an outdoor-air inlet
	Poor-quality wood		Only use the recommended fuel
Safety valves do not close 100%	Impurities in seal joint		Run cold water through the valve several times to clean it of impurities. Fit filters to prevent impurities from entering.
	Deformation of seal joint		Fit a new valve
Water condenses (after the appliance has been lit more than 3 or 4 times)	Too little wood loaded		Load as recommended. Loads notably smaller than those recommended lead to low smoke temperature and condensation.
	Green or damp wood		Use hard woods, cut at least 2 years ago and stored in a sheltered, ventilated place.
	Condition of the flue		Lengthen the flue (5-6 metres minimum). Insulate the flue properly. Check the airtightness of the flue/appliance.
	Water circuit		Failure or lack of mixing valve anti-condensation system. Output of the water system not in proportion to the heating appliance. The circulation pump must be activated when the water temperature is over 55°C

7. PRODUCT RECYCLING

The recycling of the appliance is the exclusive responsibility of the owner, who must act in compliance with the laws in force in his country regarding safety, respect and protection of the environment. At the end of its useful life, the product must not be disposed of with urban waste.

It can be delivered to the specific selective collection centers set up by the municipalities, or to retailers who offer this service. The selective disposal of the product avoids possible negative consequences for the environment and for health and makes it possible to recover the materials of which it is composed, thus obtaining significant savings in terms of energy and resources.

It can be disassembled (the parts are assembled with screws or rivets) and the components can be deposited in their corresponding recycling channels. The components of the appliance are: steel, cast iron, glass, insulating materials, electrical material, etc.

Las prestaciones del producto identificado en el punto 1 son conformes con las prestaciones declaradas en el punto 6.
 La performance du produit cité au point 1 est conforme à la performance declare au point 6.
 La prestazione del prodotto di cui al punti 1 è conforme alla prestazione dichiarata di cui al punto 6.
 The performance of the product referred to in point 1 is consistent with the declared performance in point 6.
 As declarações do produto identificado no ponto 1, estão conformes com as prestações declaradas no ponto 6.

La presente declaración de prestaciones se emite bajo la única responsabilidad del fabricante, indicado en el punto 3.
 Cette déclaration de performance est délivrée sous la responsabilité exclusive du fabricant cité au point 3.
 Si rilascia la presente dichiarazione di prestazione sotto la responsabilità esclusiva del fabbricante di cui al punto 3.
 This declaration of performance is issued under the manufacturer's sole responsibility referred to in point 3.
 É emitida a presente declaração de desempenho sob a responsabilidade exclusiva do fabricante referido no ponto 3.

CH-C-015B

DECLARACIÓN DE PRESTACIONES Conforme al R. E. Productos Construcción (UE) Nº 305/2011

DÉCLARATION DE PERFORMANCE Selon le Règlement (UE) Nº 305/2011

DICHIARAZIONE DI PRESTAZIONE In base al Regolamento (UE) Nº 305/2011

DECLARATION OF PERFORMANCE According to Regulation (UE) Nº 305/2011

DECLARAÇÃO DE PRESTAÇÕES Em base com o Regulamento (UE) Nº 305/2011

1. Nombre y/o código de identificación única del producto:
 Nom-code d'identification unique du produit
 Nome-codice identificativo unico del prodotto
 Unique identifier nome-code for product
 Nome-código de identificação único do produto
 - Marca, marque, marca, mark, marca: **Lacunza**
 - Tipo, type, tipo, type, tipo: **Chimenea calefactora, Appareil insérable, Apparecchio a incasso, Insertable appliance, Aparelho encastrável** Modelo, modèle, modello, model, modelo: **SARRIA-20 CALEFACTORA, SAKAN-20 CALEFACTORA**
2. **Uso o usos previstos del producto:** Chimenea de carga manual, para quemar combustibles sólidos (indicado en instrucciones), cuya función es calentar el espacio en el que está instalada y proporcionar también agua caliente sanitaria y/o calefacción central.
Utilisation prévue du produit: Appareil insérable qui se charge manuellement, conçu pour brûler des combustibles solides (indiqués dans le Manuel d'Instructions), dont la fonction est de chauffer l'espace où il est installé (et de fournir de l'eau chaude sanitaire et/ou le chauffage central).
Usi previsti del prodotto: Apparecchio a incasso a carico manuale, per bruciare combustibili solidi (indicati nelle istruzioni), la cui funzione è riscaldare lo spazio in cui è installato (e fornire anche acqua calda sanitaria e/o riscaldamento centrale).
Entended uses of the product: Insertable appliance to be loaded by hand and designed to burn solid fuels (indicated in instructions), whose function is to heat the space in which it is installed (and also provide hot water and/or central heating).
Utilização prevista do produto: Aparelho encastrável de carga manual, para queimar combustíveis sólidos (indicado nas instruções), cuja função é aquecer o espaço no qual está instalado (e proporcionar também água quente sanitária e/ou aquecimento central).
3. Nombre y dirección del fabricante: **LACUNZA KALOR GROUP S.A.L.**
 Nom et adresse du fabricant: **Pol. Ind. Ibarrea 5A 31800 Alsasua (Navarra) (España)**
 Nome e indirizzo del fabbricante: **Télefono: (0034) 948563511**
 Name and adress of the manufacturer: **Fax: (0034) 948563505**
 Nome e endereço do fabricante: **Email: comercial@lacunza.net**
4. Sistema de evaluación y verificación de la constancia de las prestaciones: **3**
 Système d'évaluation et contrôle de la constance de performance: **3**
 Sistema di valutazione e verifica della costanza della prestazione: **3**
 Assessment and verification system for constancy of performance: **3**
 Sistema de avaliação e verificação da regularidade do desempenho: **3**

Las prestaciones del producto identificado en el punto 1 son conformes con las prestaciones declaradas en el punto 6.

La performance du produit cité au point 1 est conforme à la performance déclarée au point 6.

La prestazione del prodotto di cui al punto 1 è conforme alla prestazione dichiarata di cui al punto 6.

The performance of the product referred to in point 1 is consistent with the declared performance in point 6.

As declarações do produto identificado no ponto 1, estão conformes com as prestações declaradas no ponto 6.

La presente declaración de prestaciones se emite bajo la única responsabilidad del fabricante, indicado en el punto 3.

Cette déclaration de performance est délivrée sous la responsabilité exclusive du fabricant cité au point 3.

Si rilascia la presente dichiarazione di prestazione sotto la responsabilità esclusiva del fabricante di cui al punto 3.

This declaration of performance is issued under the manufacturer's sole responsibility referred to in point 3.

É emitida a presente declaração de desempenho sob a responsabilidade exclusiva do fabricante referido no ponto 3.
